

Problem Statement: Smart Weather Forecast Application

Weather conditions can change rapidly, affecting daily activities, travel plans, agriculture, and public safety. People often rely on multiple sources to obtain weather updates, making it difficult to access accurate and real-time information in one place.

The objective of this project is to develop a **Smart Weather Forecast Application** that provides users with real-time weather information, hourly and weekly forecasts, severe weather alerts, and location-based weather updates. The application should fetch weather data from reliable APIs and present it through an intuitive and user-friendly interface.

Key Features

- Real-time weather updates
- Current temperature, humidity, wind speed, and air quality
- Hourly and 7-day weather forecasts
- Location-based weather detection using GPS
- Search weather by city name
- Severe weather alerts and notifications
- Interactive weather charts and visualizations
- Dark/Light mode support

Expected Outcome

The application should help users make informed decisions about travel, outdoor activities, and daily planning by providing accurate, timely, and easily accessible weather information.
